“At best a good compete heavy”

is changed to

-- At best a good complete heavy --

3. CLAIMS:

Office Action disallowed claims (5 to 9) of record accordingly applicant deletes same. Note that the applicant by deleting claims (5 to 9) of record is not agreeing that the Office Action cited patent references necessarily infringing upon same, but only that the Office Action allowed claims (1 to 4) of record are acceptable to the applicant for advancing the case to final action.

In addition, the applicant has added minor word changes to claims (1 to 4) of record without affecting their substance.

Applicant wishes to cancel claims of record (1 to 9) and substitute new claims (10 to 13) as follows:

10. A pressurized fluid control mechanism including tilt / push / pull operation comprising:

a. a housing;

b. a lever operator;

- c. a swivel joint slideably secured to said housing and supportive of said lever operator in a manner allowing said lever operator both tilting motion and axial motion;
- d. an actuator means extending radial reach of said lever operator and capable of applying actuation forces is attached to said lever operator and movable therewith;
- e. a first series of valves is attached to said housing and arranged about said lever operator axis so as to be selectively actuated by tiltable movement of said lever operator;
- f. a second series of valves is attached to said housing and arranged circularly about said lever operator and near said actuator means so as to be actuable by upward axial motion of said actuator means;
- g. a third series of valves is attached to said housing and arranged circularly about said lever operator and near said actuator means so as to be actuable by downward axial motion of said actuator means.

11. The pressurized fluid control mechanism including tilt / push / pull operation of claim 10, including a pressure regulator plumbed in series with each valve of said second series of valves wherein each of said valves of second series of valves can control with it's own unique pressure.

12. The pressurized fluid control mechanism including tilt / push / pull operation of claim 10, including a pressure regulator plumbed in series with each valve of said third series of valves wherein each of said valves of third series of valves can control with it's own unique pressure.

13. The pressurized fluid control mechanism including tilt / push / pull operation of claim 10, including a means surrounding said lever operator capable of assisting accurate angular alignment by said lever operator to specific valve of said first series of valves, and with minimal chance for accidental activation of other valves of said first series valves.
